The fundamentals of the automated airline cockpit are introduced to commercial multiengine instrument pilots who aspire to fly for an airline company in this handy book. Whether it is a turboprop, a regional jet, a Boeing, or an Airbus, nearly every airliner in operation today contains a flight-management system, autopilot, and other glass-cockpit systems, which represent a gap between the skills learned during general aviation training and experience and the skills pilots are expected to have when they begin their airline flying career, and this book gives a head start on bridging that gap and acquiring those necessary skills. Unlike the typical theory-oriented systems manuals, The Pilot's Guide to the Airline Cockpit places readers in the left seat and takes them step by step through a challenging line flight, providing for real-world application. It teaches how to use the flight-management system and autopilot to plan and follow an assigned route and how to deal with realistic en route scenarios, including vectors, intercepts, holds, diversions, late descents, and many others. Along the way, readers learn how to decide which automation features to use and when, the limits of the automation's capabilities, how to monitor the progress of a flight, and how to remain in the loop while the automation performs its work. Updated to catch up to newer practices, this revised second edition is essential reading for those who desire to fly for an airline, and it is the ideal companion for transitioning from general aviation to regional jets and larger transport-category airplanes.

If you are either an Airbus-driver or a serious flight simmer, this collection of information is something that should pique your interest. Learning to understand and operate one of the world's most complex machines is a tall request from a simple book like this ... and Captain Mike Ray is up to the task. His treatment of the airplane systems and operational techniques is written in an interesting and entertaining way ... and makes learning the difficult and complex ... well, almost easy. This over 400 page document is lavishly illustrated in full color to take advantage of the increased learning potential in the use of color. There can be no doubt that the Airbus A320 is a color driven systems airplane and this book attempts to take full advantage of the use of color in describing and illustrating the operations of the airplane systems and controls. Whatever price penalty is incurred in the purchasing of this color volume is well worth the investment in increased learning potential.

Captain John A. Moktadier graduated and received his Bachelor's Degree from Embry-Riddle Aeronautical University in Daytona Beach, Florida. He has been flying for the past 35 years and currently holds both a Gold Seal Flight Instructor and Advanced Ground Instructor licenses from the FAA. Capt. Moktadier has four type ratings which include: Airbus 330, Airbus 320, Boeing 747 and Boeing 727. He has logged over 24,000 hours flight time with the majority of his hours in jet transport and wide body aircraft. He has flown around the world. Captain Moktadier served as a Boeing 727 Check Airman (TRE) and conducted rating rides, proficiency checks, instructions and simulator checks and line checks for over 10 years with a commercial airline in the United States. He has trained hundreds of pilots with no failures and well above average results. The pilots he has trained have lots of respect for Capt. Moktadier's knowledge and his training style made them feel relaxed during the entire simulator session maximizing their learning due to his teaching ability, honesty and integrity. They have all commented that he is a true professional instructor and TRE. This is his second book that he has published. The first one was Boeing 727 Flight Master which received many outstanding and excellent reviews and positive feedback from the professionals in the airline industry who read the book and it soon became one of the best training books on a Boeing 727.

Learning about an aircraft seems to have no end, a thought very close to reality when it comes to complex aircraft. Pilots spend much of their lives, training their flight techniques in a certain aircraft, learning its systems and its operations. The collection of A320 offered by the aeronautical library, is the most complete guide on all the knowledge that a pilot must learn about this wonderful aircraft. This new edition covers all the topics related to the understanding of the QRH (Quick Reference Handbook), its content and its correct way of using it. The QRH of an aircraft, is its quick reference manual, where the pilot can consult about normal and abnormal procedures, use performance tables, know limitations of the aircraft and everything related to the successful operation of the A320. A new contribution to the most complete A320 collection in Spanish on the market.
