Over two billion people worldwide are at risk for the spectrum of disorders known as "The Iodine Deficiency Disorders." 1-10% will suffer cretinism; 5-30% will have some sort of brain damage or neurological impairment and 30-70% will be hypothyroid. The causes of iodine deficiencies can be considered from both simplistic and more complex perspectives: From the leaching of iodine from soil resulting in crops with low iodine content to malnutrition resulting in impaired iodine absorption. Poor dietary diversification and impoverished socio-economic development can also lead to iodine deficiencies. Although it is possible to diagnose and treat deficiencies, there is still an ongoing dialogue regarding the detailed molecular pathology of iodine homeostasis, how hypothyroidism impacts the body tissues, and efficient diagnosis and treatment of the Iodine Deficiency Disorders. This Handbook provides a resource of information on the various pathways and processes based on different countries or diseases. Because there is a constant flow of new information on iodine and related disorders, the goal of this Handbook is to provide a base of scientific information upon which additional knowledge can be applied. Provides important information on one of the most common micro-nutrient deficiencies in the world, the most important "single nutrient-multiple consequences" paradigm today Includes information on iodine-related diseases, including those that are common, preventable and treatable Provides insight from a broad perspective of viewpoints -- from subcellular transports to economic impact

For many years, addiction research focused almost exclusively on men. Yet scientific awareness of sex and gender differences in substance use disorders has grown tremendously in recent decades. This volume brings together leading authorities to review the state of the science and identify key directions for research and clinical practice. Concise, focused chapters illuminate how biological and psychosocial factors influence the etiology and epidemiology of substance use disorders in women; their clinical presentation, course, and psychiatric comorbidities; treatment access; and treatment effectiveness. Prevalent substances of abuse are examined, as are issues facing special populations.

Drugs discussed include benzodiazepine, cocaine, marijuana, phencyclidine, amphetamines, nicotine, hallucinogens, sedatives-hypnotics, anabolic-androgenic steroids, methadone, and opioids. Also discusses drug and alcohol effects on pregnancy and the newborn, women, alcohol and drugs, alcohol and drug addiction in the elderly, eating disorders and drug and alcohol addiction, drug and alcohol addiction and AIDS, suicide in drug and alcohol addiction, drug and alcohol use and addiction among physicians, and gambling problems in alcoholics and drug addicts.
