The achievement gaps in science and the under-representation of minorities in science-related fields have long been a concern of the nation. This book examines the roots of this problem by providing a comprehensive, 'state of the field' analysis and synthesis of current research on science education for minority students. Research from a range of theoretical and methodological perspectives is brought to bear on the question of how and why our nation's schools have failed to provide equitable learning opportunities with all students in science education. From this wealth of investigative data, the authors propose a research agenda for the field of science education - identifying strengths and weaknesses in the literature to date as well as the most urgent priorities for those committed to the goals of equity and excellence in science education.

Sure, you teach science. But do your students really learn it? Students of all ages will absorb more if you adapt the way you teach to the way they learn. That's the message of this thoughtful collection of 12 essays by noted science teachers. Based on the latest research, this is definitely a scholarly book. But to bring theories to life, it includes realistic scenarios featuring classrooms where students are encouraged to construct their own science learning. These scenarios will give you specific ideas on how to help your students become more reflective about their learning process, including what they know, what their stumbling blocks are, and how to overcome them. You'll also examine how to use formative assessment to gauge student learning during the course of a lesson, not just at the end.

interdisciplinary field that encompasses astronomy, biology, geology, heliophysics, and planetary science, including complementary laboratory activities and field studies conducted in a wide range of terrestrial environments. Combining inherent scientific interest and public appeal, the search for life in the solar system and beyond provides a scientific rationale for many current and future activities carried out by the National Aeronautics and Science Administration (NASA) and other national and international agencies and organizations. Requested by NASA, this study offers a science strategy for astrobiology that outlines key scientific questions, identifies the most promising research in the field, and indicates the extent to which the mission priorities in existing decadal surveys address the search for life's origin, evolution, distribution, and future in the universe. This report makes recommendations for advancing the research, obtaining the measurements, and realizing NASA's goal to search for signs of life in the universe.
